Senkevich, V. F.; Malygin, Yu. N.; Malygina, L. V. Hardening 37KhS Steel Parts  
in Hot Media

41

The investigation on which this article is based made it possible to establish optimum conditions for fused-alkali heat treatment of threaded machine parts made of 37KhS steel. The advantages of this method of hardening are demonstrated. This method has already been put into practice at the Urals RR.-car Plant, where a mechanized line for isothermal bright hardening of articles made of 37KhS steel has been set up.

Sagaradze, V. S. Kotel'nikova, R. I. Properties of G13 Manganese Steel as Determined by Chemical Composition and Heat Treatment

54

As a result of the author's investigations: (1) optimum conditions for heat treating parts made of G13L steel were established (2) a method for quality control was proposed. (3) the effect of various elements on the properties of this steel was determined, and (4) a table of microstructures was developed

Card 3/5

for determining and controlling the quality of heat treatment. There are  
4 Soviet references

**Khlopotova, N. I. Heat Treatment and Quality-control Methods for Cast-  
ings Made of 32Kh06L Steel**

70

The author concludes that the most favorable combination of strength and  
plastic properties of 32Kh06L steel is obtained by hardening at 880° C.  
with subsequent water quenching.

**Kotel'nikova, R. I. Hydrogen Embrittlement in Springs and Ways of Preventing it** 76

The author investigates hydrogen embrittlement caused by pickling and electro-  
galvanizing. She states that in the first case embrittlement can be pre-  
vented by using "ChM" additive consisting of a foaming agent and a solvent in  
the pickling solution. In the second case it can be eliminated by temper-  
ing at 150-200° C.

Orig Pub : Sots. s.kh. Uzbekistana, 1957, No 4, 72-73.

Abstract : Experiments were made in the kolkhozes of Uzbekistan in 1953 to test the efficiency of crossgrafting the low yielding Novogruzinskiy lemon trees with the high yielding Chinese lemon (Meyer's). The best method turned out to be grafting in the bark (with nearly 100% viability), the best time was from the beginning of vegetation to 10-15 June; the yield of Novogruzinskiy lemon trees in whose bark Chinese lemon graftings were inoculated was considerably increased.

TITLE: Radiation grafting<sup>of</sup> of styrene and methylmethacrylate on chlorinated poly(vinyl chloride).

SOURCE: Uzbekskiy khimicheskiy zhurnal, no. 4, 1965, 40-44

TOPIC TAGS: polymer<sup>4415</sup>, irradiation, polyvinyl chloride, styrene, methylmethacrylate, thermomechanical property, elasticity, gamma ray.

ABSTRACT: To avoid oxidative destruction, the authors applied the direct method of simultaneous irradiation of the polymer and the monomer in the absence of oxygen. The chlorinated poly(vinyl chloride) (I),  $\eta$  0.80 in  $(CH_2Cl)_2$  at 25°C, styrene (II), and Methyl methacrylate (III) were additionally purified from any traces of admixtures. The experiments were carried out as follows. To powdered I in an ampul was added II or III, respectively, the ampul was evacuated by the usual

method of freezing and melting, at  $10^{-3}$  -  $10^{-4}$  mm, sealed in vacuo, and irradiated by  $\gamma$ -rays ( $^{60}\text{Co}$ ) in doses of 0.25-6.0 mr, intensity 200 r/sec. The experimental results (dose, ratio I-II or I-III, weight gain after extraction of monomer, II- or III-content in the copolymer, and % yield of the final product) are given. Owing to the resistance of the benzene nucleus, graft copolymerization of II requires higher radiation doses than that of III. Determinations of thermo-mechanical properties of the copolymers showed that grafting II or III onto I results in a decrease of the Mackian elasticity region of I. Orig. art. has 2 figures and 2 tables.

ORG: Tashkent State University im. V. I. Lenina (Tashkentskiy gosuniversitet)

TITLE: Grafting of methyl methacrylate to butyl rubber under the influence of gamma radiation

SOURCE: Uzbekskiy khimicheskiy zhurnal, no. 5, 1965, 59-62

TOPIC TAGS: gamma irradiation, irradiation effect, graft copolymer, butyl rubber, polymethyl methacrylate, methylmethacrylate, polymer, monomer

ABSTRACT: Graft copolymers of butyl rubber (copolymer of isobutylene with 2.0-3.0% isoprene) with methyl methacrylate were synthesized radiochemically by simultaneously irradiating a mixture of the polymer and monomer in the absence of atmospheric oxygen with  $\text{Co}^{60}$  gamma rays. After extraction of the polymethyl methacrylate homopolymer (PMMA), the degree of grafting and yield of the graft copolymer decreased with increasing irradiation dose for a polymer-to-monomer ratio of 1:1 and 1:0.6, and also in the solvent dichloroethane. The copolymers formed had a variable composition; their formation was confirmed by turbidimetric titration. A study of the kinetics of swelling of the copolymers in various liquids showed that the nature of the side chain in the

Card 1/2

2

L 23710-66

ACC NR: AF6008693

graft copolymer causes a decrease in the affinity of the system obtained for some liquids and an increase for others. A study of the viscosity of solutions of the graft copolymers in benzene at 30°C revealed that as the content of graft PMMA in the copolymer diminishes (with rising irradiation dose), the intrinsic viscosity of the solutions decreases. This is attributed not only to a drop in the proportion of graft PMMA in the copolymer but also to the degradation of macromolecules of the initial polymer under the influence of gamma radiation. Orig. art. has: 2 figures, 1 table.

## ABSTRACT:

Sedimentation analysis and studies of fragmented phage DNA reveal the DNA of phage 1F7 to be a closed circular polynucleic chain with a molecular weight between  $1.6-1.7 \times 10^6$  units, with single-stranded DNA. The authors are convinced that circular stranded DNA is not an artifact and present preliminary data to support their view. [WA-50; CDE No. 11]

TITLE: Infrared absorption spectra of grafted copolymers of cellulose with certain vinyl monomers

CITED SOURCE: Sb. Fizika i khimiya prirodn. i sintetich. polimerov. Vy\* p. I. Tashkent, AN UzSSR, 1962, 29-34

TOPIC TAGS: spectroscopy, infrared absorption spectrum, polymer, polymer absorption spectrum, grafted copolymer, cellulose, cellulose copolymer, polyvinyl, radiopolymerization

TRANSLATION: By the method of radiation initiation of mixtures of cellulose with certain vinyl monomers, grafted copolymers of cellulose with methacrylate methylmethacrylate, methacrylamide, acrylonitrile and styrene were obtained and their infrared spectra were studied. In the spectrum of copolymers with methacrylate and methylmethacrylate, an intensive band appeared at  $1730 \text{ cm}^{-1}$  which corresponds to valence vibrations of a carbonyl group. At the low frequency end of the spectrum, characteristic absorption bands were obtained at  $745$  and  $837 \text{ cm}^{-1}$  for the copolymer with methacrylate and at  $745$  and  $826 \text{ cm}^{-1}$

for the copolymer of methylmethacrylate. In the spectrum of the copolymer with methacrylamide, the intensity of absorption increased in the area of  $3300\text{ cm}^{-1}$ , the band valence vibrations of C-H shifted from 2900 to the area of  $2870\text{ cm}^{-1}$ , and bands appeared at  $1663\text{ cm}^{-1}$ , (vibration of C = O in the group O = C(NH<sub>2</sub>),  $1600\text{ cm}^{-1}$  (deformation vibrations of NH<sub>2</sub>) and  $1745\text{ cm}^{-1}$  (deformation vibrations of the CH<sub>3</sub> group in the methacrylamide). For the copolymer with acrylonitrile, a characteristic band at  $2250\text{ cm}^{-1}$  appeared (valence vibrations of the nitrile group). The bands at 700 and  $748\text{ cm}^{-1}$ ,  $1603\text{ cm}^{-1}$  (vibrations of the double bands of an aromatic nucleus) and  $1500\text{ cm}^{-1}$  (vibrations of the benzene ring) were the most reliable for the identification of the copolymer with styrene. The infrared spectra of the studied copolymers can be used for the qualitative evaluation of the degree of grafting.

TITLE: Infrared absorption spectra of copolymers of sylvan Alpha-methylfuran with dimethyldichlorosilane

CITED SOURCE: Sb. Fizika i khimiya prirodn. i sintetich. polimerov. Vy\* p. I. Tashkent, AN UzSSR, 1962, 149-154

TOPIC TAGS: spectroscopy, absorption spectrum, infrared absorption spectrum, polymer absorption spectrum, sylvan, Alpha-methylfuran, dimethyldichlorosilane, organosilicon polymer

ABSTRACT: The infrared absorption spectra of polysylvan and copolymers of sylvan with dimethyldichlorosilane were studied. In the copolymer spectrum, bands at  $1260\text{ cm}^{-1}$  (deformation vibrations of the Si-CH<sub>3</sub> bond) and at  $1100\text{ cm}^{-1}$  were detected, corresponding to vibrations of the Si-O bond in polydimethylsiloxane. The authors assume that, under the conditions of the reaction, hydrolysis of dimethyldichlorosilane takes place, followed by the formation of polydimethylsiloxane groups which form copolymers during the reaction with

sylvan. The individual sylvan units in the copolymer are linked with siloxan bridges. The amount of Si in the copolymer increases when the content of dimethyldichorosilan in the reaction mixture is increased (up to ~17-18%, after which it remains constant). The band at  $1260\text{ cm}^{-1}$  can be used for the quantitative determination of the Si content in the copolymer. A. Korobko.

TITLE: IR spectra of copolymers of acrylonitrile and 2-methylfuran

SOURCE: Vy'sokomolekulyarnye soyedineniya, v. 6, no. 6, 1964, 997-1000

TOPIC TAGS: copolymer, acrylonitrile, furan, 2-methyl, copolymer Ansil, radiation induced copolymerization, bulk copolymerization, solution copolymerization

ABSTRACT: The IR spectra of acrylonitrile--2-methylfuran (Ansil') copolymers have been studied. The copolymers were prepared by irradiating mixtures of the pure monomers both in bulk and in various solvents from a Co<sub>60</sub> source. The study has confirmed the formation of copolymers. From the results it was assumed that in radiation-induced copolymerization of acrylonitrile and 2-methylfuran in solution, solvent molecules add to the ends of the copolymer molecules and accelerate termination. This assumption was confirmed by the fact that "Ansil'" copolymers prepared in solution have a lower molecular weight than those bulk copolymerized.

products of the reaction of cellulose and epichlorohydrinSOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 12, 1965, 2132-2138TOPIC TAGS: cellulose, polymer, cellulose plastic, synthetic fiber, electron  
microscopy, molecular structure, ~~acted~~ mechanical propertyABSTRACT: The supermolecular structure and some of the properties of the products  
obtained in the reaction between cellulose and epichlorohydrin were studied to  
elucidate the effect of supermolecular structure on the properties of cross-linked  
cellulose derivatives. The work was carried out mainly by electron-microscopy, but  
IR and x-ray spectra were also investigated. Mechanical properties such as strength,  
elongation, etc under dry and wet conditions were also studied. The results are  
presented in graphs and tables (see Fig. 1). It is concluded that the reaction of  
epichlorohydrin with cellulose proceeds via a bifunctional mechanism forming intra-  
molecular cross-links, and it is suggested that, in the case of intermolecular
